

### Antivirus/Firewall

*powered by SMOBILE Systems*

**The iMDM Advantage** - Antivirus and Firewall are both parts of InnoPath's comprehensive Integrated Mobile Device Management Security Suite. The iMDM Security Suite suite allows network operators to manage the Antivirus and Firewall applications over their entire lifecycle, from installation, activation, configuration and update to eventual deactivation and removal of the applications from the handset.

**Antivirus** - Viruses, worms, trojans, redirectors and other malware are on the rise and are increasingly being written to target mobile devices. These threats are exploiting SMS, MMS, Bluetooth, WiFi, infrared and desktop sync to spread, making effective protection crucial.

Features and Benefits:

- Central management
- Server pushes updates and scan jobs to handsets
- Detailed logging
- Sophisticated heuristics help protect against new and undefined threats.

**Firewall** - The number and sophistication of mobile threats is increasing, both from within the operator network as well as via WiFi, Bluetooth, desktop sync, infrared and other avenues. While protection on the operator network helps, there is a real need for protection on the device itself.

Features and Benefits

- Central management
- Server pushes updates and configurations to handsets
- Detailed logging
- Three levels of filters and customizable whitelists and blacklists
- Bidirectional filtering - blocks inbound threats, protects from harmful content and spread of malware

**About SMOBILE Systems** - SMOBILE Systems, based in Columbus, Ohio, creates innovative mobile security solutions for virtually all mobile device platforms. They develop and market software that prevent intrusions and data compromises on nearly 300 devices across the full range of mobile OS's, including Symbian, Windows Mobile, Palm, RIM, and Linux. The SMOBILE Systems website can be found at [www.smobilesystems.com](http://www.smobilesystems.com).
